

# BONE HEMOSTASIS

## Ethicon Bone Wax

## Ethicon Bone Wax

|                                    |  |
|------------------------------------|--|
| <b>Description</b>                 | A sterile mixture of beeswax, paraffin, isopropyl palmitate, a wax-softening agent.  |
| <b>Action/<br/>Performance</b>     | Achieves local hemostasis of bone by acting as a mechanical (tamponade) barrier. It does not act biochemically and is minimally resorbable.                                    |
| <b>Indications</b>                 | For control of bleeding from bone surfaces during surgical operations.   |
| <b>Directions &amp;<br/>Dosage</b> | Bone wax should be used immediately after removal from the package. Using aseptic technique, bone wax should be warmed to desired consistency by manipulation with the finger. |
| <b>Packaged</b>                    | Each containing 2.5 grams.   |
